

ABSTRACT OF THE DISCLOSURE

~~This invention is intended to improve a sealability for sealing between a cover member and a container main body and to improve a detachability of the cover member.~~ A double-seal mechanism is provided on at the cover member for sealing closed a container main body. The double-seal mechanism includes an inner seal piece that seals an interior of the container main body and is positioned while being put between an inner seal reception section of a flange of the container main body and a seal pressing section of the cover., ~~and an~~ An outer seal piece forms a second seal that seals an abutment portion between the container main body and the periphery of the cover member. ~~the inner seal piece and the inner seal reception section.~~ The inner seal piece has a rounded distal end bulge section fitted into at the fitting groove in the flange is provided on a tip end of the inner seal piece. A cover member fixing unit of the cover member includes a latch shaft that is linearly projected from and retracted ~~toward the cover member,~~ a latch roller attached to a tip end of the latch shaft, and a crank mechanism that linearly projects and retracts the latch shaft as from and toward the cover member when the crank mechanism rotates. The latch roller travels along an inclined A cover member retracting surface for retracting the cover member toward on the container main body which forces the cover member inward into sealing engagement with ~~while the latch roller rotates is provided on the container main body.~~
